

Government and Public Sector Financials

Government and Public Sector Financials

Government presents special challenges for fiscal management. Multiple funding sources, multiple objectives and multiple spending through many departments and programs make it hard to determine whether or not the desired outcome has been achieved for the money invested. Even when such determinations can be made, the passage of time makes it hard to change direction.

Salient's mission, and our software solution are first about making it practical to reconcile public spending with its intended result and, second, making it much faster and easier for responsible persons to process this knowledge into beneficial action.

Our UXT® software serves as an automatic device for measuring the efficiency of government. Every day, it joins data from every part of government - operational, financial, status, etc. - to create a comprehensive replica of the government business environment.

These measures, in turn, become instantly visible to everyone who needs to see them can see clearly the rate of budget consumption and the relationship between activity and desired outcomes. Sheer speed, together with simple "point and click" access to the facts, gives them the power to act on information to improve service quality and budgetary efficiency at the same time.

At last, government data can become a vital instrument for improving government itself.
